

SILVER

ALDOKOTE 107-P

Is formulated for use as a single-dip chromate type passivating treatment over silver plated surfaces, producing films that are non-iridescent, clear, protective and tarnish resistant.

The Aldokote 107 P treatment provides excellent protection towards retarding the formation of corrosion products on silver surfaces where appearance and functional performance are critically important.

Electrical or electronic components which are silver plated will not undergo critical dimensional changes, nor will the film adversely affect subsequent soldering or brazing operations. The electrical contact resistance of the film is of low order.
